

SERIES D1
VALVE ISLAND WITH
COILVISION TECHNOLOGY

COILVISION
TECHNOLOGY

Series D1 valve islands can be connected to the main fieldbus protocols through the serial module. This combination makes it easy to integrate pneumatic and electrical functions in the most advanced automation systems, as it allows an increase in the number of controllable valves and interconnection of analog and digital I/O modules in a single network node. The Series D1 valve island is also equipped with CoilVision technology which can monitor and predict the wear and efficiency status of some parts of the solenoid valves.

 **Individual, modular sub-bases in technopolymer**

 **Integrated diagnostics and predictivity**

PROFIBUS-DP, CANopen,
 EtherNet/IP, PROFINET,
 EtherCAT, IO-Link
